

Zellio: Revenue & Business Model

Project Name: Zellio **Focus:** Institutional-grade RWA tokenization engine for Southeast Asia

Executive Summary

Zellio's business model is designed to capture value across the entire lifecycle of a tokenized Real World Asset (RWA). By servicing both the supply side (asset issuers) and the demand side (institutional and retail investors), Zellio ensures sustainable revenue generation. Our core monetization strategy relies on a combination of automated on-chain transaction fees and B2B issuance services.

1. Secondary Market Trading Fees (On-Chain)

The primary, automated revenue driver for Zellio is built directly into our smart contract infrastructure, optimized for both agility and investor protection.

- **The Mechanism:** The `PermissionedDEX.sol` contract enforces a **dynamic platform fee** (`platformFeeBps`), initialized at **0.5%** (50 BPS). To provide absolute trust and investor protection, a security guardrail limits the maximum fee to **5.0%** (`MAX_FEE_BPS = 500`), preventing any administrative abuse.
- **How it Works:** Every time verified investors trade tokenized assets (such as our Solar Sukuk Series I) against stablecoins (USDC or MYRC), the platform fee (initially 0.5%) is automatically skimmed during the settlement process.
- **Value Capture:** These fees are trustlessly routed to the protocol's designated `feeRecipient` treasury address, ensuring immediate and transparent revenue realization on every trade executed within our walled, compliant ecosystem.

2. Asset Tokenization & Issuance (B2B Services)

While trading fees provide continuous automated revenue, our primary clients are traditional finance entities and asset issuers who require our infrastructure to bring their assets on-chain.

- **Origination & Structuring Fees:** We charge issuers a flat fee or a percentage of the total capital raised when they use our "Issuer Portal" to deploy a new ERC-3643 compliant Sukuk or private credit token. This covers the cost of legal structuring, KYC/AML integration, and smart contract deployment.
- **Lifecycle & Management Fees:** We provide ongoing SaaS-like infrastructure for cap table management and automated yield distribution (via our `YieldDistributor.sol` contract). We charge a small percentage on the yields distributed or an annual maintenance fee for maintaining the compliance engine and registry updates.

Summary Statement

"Zellio monetizes institutional liquidity. We charge issuers a premium service fee to securely digitize and manage their assets, and we capture a 0.5% volume fee on all secondary market trading that occurs within our compliant infrastructure."
